

МЕТОД ОЦЕНКИ РАБОТОСПОСОБНОСТИ ОПТИЧЕСКОГО И ЭЛЕКТРОННОГО ТРАКТА ДЛЯ ПОДСИСТЕМЫ BBC В ДЕТЕКТОРЕ SPD

A.V.Tishevsky on behalf of JINR-MEPHI BBC

*LXXV Международная конференция «ЯДРО-2025. Физика атомного ядра
и элементарных частиц. Ядерно-физические технологии»*

1 июля 2025, Санкт-Петербург

- ❑ Introduction for BBC subsystem
- ❑ R&D tests
 - hardware
 - method
 - the comparing of the attachment techniques
 - the scan by SGF length (comparing of SGF diameters)
 - the scan by SGF length (comparing of WLS)
 - test of full optical and electronic path
 - the method of assembled sector fast check
- ❑ Prospects
- ❑ Conclusion

Introduction

General

Spin Physics Detector

BBC Sector (1/16 of wheel) design

26 tiles

TDR 2023

2 wheels with
400 tiles each (416)

- + local polarimetry
- + event plane detector for HI physics

The verification in the mass production process

- check the uniformity of the tiles
see: A. Zakharov
- **method for estimating the efficiency of an optical and electronic path**

The method will allow us to check the path:

- immediately
- monitoring the change in the detector over time

CAEN FERS 52XX is an extendable high speed front-end readout system

- DT5203 (picoTDC chip) **Hybrid mode**
 DT5215 (Concentrator) **(LG+ToT+ToA)**
- DT5202 (x2 Citiroc 1A chip)

Stand for BBC measurements

Schematic view of the LED

SiPM SensL 1x1 mm²
 (MicroFC-10035 SMTPA)

Diameters of SGF

The “FersRun” framework has been designed.

This methods based on side glow fiber (SGF). In principle: the LED light transmitted along the SGF. We attached the WLS to SGF, and then the optical signal passes through the optical path and detected by SiPM.

(WLS <-> Clear Fiber <-> SiPM <-> DT5202 unit)

Item no.	Diam-1.5, 2, 2.5, 3, 3.5, 4, 5, 6, 8, 10, 12, 14, 16, 18mm
Item name	Solid core Side glow Optic fiber
Fiber core material	Methyl Methacrylate (MMA)
Cladding material	Polytetrafluoroethylene(PTFE)(Telfon)
Jacket material	N
Core refractive index	1.55
Cladding refractive index	1.50
Refractive index Profile	Step
Wavelength range	350 -780nm
Max bending radius	5X diameter
Working temperature	-20 – 100°C
Storage temperature	10-50 °C

Led
(light)

1-st attachment technique

- The difference between the attachment techniques is at the range of 50-60%.
- The 2-nd method is a priority, both from the point of view of simplicity of attachment, and potentially with multi-channel connection. But increase of the light output is required.

2-nd attachment technique

- There are edge effects. They are larger for 3mm fiber.
- Attenuation of light per meter for the SGF at the level of 30%.
- The signal difference between the 2mm and 3mm diameters is **about 50%**.

2mm diameters

3mm diameters

- WLS Kuraray (Y11) is approximately **130% effective**.

Kuraray (clear fiber) cable prototype with
8 channels connector

Channel-by-channel connector test

SensL 3x3 mm²
(MicroFC-30035)
to DT5202

- the correction showed a **problem with polishing** and a **defect** for the transparent fiber
- preparing to test** the main options

1-st attachment technique (parallel to WLS)

2-nd attachment technique (perpendicular to WLS)

WLS single or group connection

WLS group connection

WLS
SGF

1-st attachment technique

- random effect

2-nd attachment technique

- the problem with the connector

Cosmic rays

Tests with SGF

2-nd attachment technique

- the signal is comparable to the mip
- different acquisition time
- perfect alternative of cosmic rays

The techniques are sensitive to fibers contact areas

required

- the tool for uniform illumination (combining all fibers into one connector)
- the scan by SGF length ($>2,5$ m)

2-nd attachment technique
(perpendicular to WLS)

reduced prototype wheel

Small prototype wheel ~ 2,1 m
Full size wheel ~ 5,0 m

The method can be useful for wheel prototype

- ✓ The method for estimating the efficiency of an optical and electronic path has been proposed.
- ✓ The possibility of increasing the light intensity was considered. The absorbed light of the Kuraray WLS is higher than Saint-Gobain Crystals WLS. The final solution is a matter of compromise between the diameter of the SGF.
- ✓ The possible method of express sector checking has been proposed. The signal is similar to minimum-ionizing particles (mips). The method is promising for evaluating the operability of the prototype and the BBC detector.

to do list:

- test of the main option of optical cable with transmission box;
- finalizing the method of express wheel check;

Thank you for the attention!

A component amount for
optical cement.

- ❑ Datasheet ratio will be used and closely monitored for mass production.

The results of tests of Kuraray WLS fiber and Saint-Gobain Crystals (SGC) WLS fiber with different types of cement are presented.

- ❑ **CKTN mark B** paired with SGC WLS fiber are the most appropriate candidates **for prototype** assembly tests.
- ❑ **CKTN mark B** paired with Kuraray WLS fiber are the most appropriate candidates for future **testbeam**.

Prototype assembling test

Amplitude spectra of two sectors

1-st sector prototype

There are 2 specific channels,
but the debugging process of
mass production continues.

2-nd sector prototype

Simplified block diagram of the DT5202 FERS-5200 unit

Citiroc-1A block scheme

Each channel has low (**LG**) and high (**HG**) gain preamplifiers providing a wide dynamic range.

- Triggers of consecutive channels are sent to an AND logic operator (e.g. CH0&CH1, CH2&CH3, etc.). The 32 outputs are then sent to an OR logic operator.
